CHURN IS DEAD

The Intervention Trigger Ledger

Turn one observed customer change into an action someone can justify and own.

Use this ledger for one recurring alert or leading signal. Connect the raw observation to a customer consequence, define when the condition is meaningful, and pre-assign the response before the next occurrence.

Use: Do not total the rows into a health score. Record one trigger, test it in operation, and review false alarms, missed conditions, timing, and ownership.

SECTION 1

Consequence and Observation

Available data is not automatically a customer-relevant signal.

Record	Question	Evidence
Customer consequence	What commitment, outcome, or decision is at risk?	Customer-confirmed record
Consequence date	When do recovery options materially narrow?	Confirmed date or expiry
Observable event	What raw event can be inspected consistently?	System and field
Evidence cadence	How often does the source refresh, and who owns its quality?	Cadence and owner

Review This Section

Decision prompt: What customer commitment or decision could fail, and what can we observe before it does?

Record: _____

SECTION 2

Baseline and Trigger Rule

Normal variation should not create the same response as consequential movement.

Rule element	Record this	Quality check
Baseline	Normal range for this account, use case, segment, or stage	Enough observations?
Threshold	Direction and amount of meaningful movement	Why this level?
Window	How long the condition must persist	Too fast or too late?
Disqualifiers	Known benign conditions to check first	Visible and testable?

Review This Section

Decision prompt: What movement, persistence, and context justify action?

Record: _____

SECTION 3

Response and Reset

A trigger is useful only when the first response and decision owner are explicit.

Record	Required detail	Owner or date
Response class	Interrupt, next working day, or monitor	Response deadline
First action	A specific action possible with available evidence	Action owner
Decision owner	Person who can resolve the underlying condition	Role and escalation
Reset rule	Observed state that closes or downgrades the trigger	Expiry or review

Review This Section

Decision prompt: What happens when the rule fires, and what clears it?

Record: _____

SECTION 4

Operational Review

Trigger quality improves through outcomes, not confidence in the original design.

Review	Record this	Change
Precision	Consequential event or benign movement?	Keep or narrow
Detection time	Usable recovery time remaining	Move window or source
Ownership	Could the assigned person act and decide?	Change owner or input
Missed condition	Was risk discovered through another route?	Add or redesign signal

Review This Section

Decision prompt: Did the trigger find a consequential condition at a useful time with the right response?

Record: _____

CHURN IS DEAD

Intervention Trigger Record

Record	Complete this
Customer consequence and date	_____
Trigger rule and response class	_____
First action and rightful owner	_____
Reset rule and review date	_____

Response class	Use when	Required record
Interrupt	Delay materially reduces recovery options	Immediate owner, action, and escalation
Next working day	The condition matters but current work need not be disrupted	Owner, due time, and customer question
Monitor	Evidence is incomplete or movement may be normal	Next observation, evidence owner, and expiry
Remove	The alert repeatedly creates no justified action	Reason, retirement date, and replacement if needed

What to do next: Choose one alert that created work in the last month. Review its five most recent occurrences, complete one ledger row, and test the rule on the next occurrence.
