
CHURN IS DEAD

The Silence Ledger

Separate automated reach from customer movement and make the next human intervention explicit.

Complete this ledger for one digital segment. Record what the system sent, what the customer did, what remains unknown, and the condition that requires a person to step in. This is an operating aid, not a retention prediction.

Use: Do not convert this ledger into a universal score. Use it to expose missing evidence, unresolved silence, and unowned intervention decisions.

Version: 1.0 -- August 2026

SECTION 1

Programme Intent

A send is not useful until the team names the customer decision or behaviour it is intended to change.

Record	Complete this	Evidence
Segment	The accounts and contacts included	Selection rule and date
Customer job	The problem the programme helps the customer complete	Customer-facing language
Intended movement	The decision or behaviour expected next	Observable completion signal
Review window	When the team will inspect the result	Named owner and date

Review This Section

Decision prompt: What customer movement should this programme create, and how would the team recognise it?

Record: _____

SECTION 2

Reach and Response

Delivery, opening, responding, and changing behaviour are different events. Combining them hides uncertainty.

Layer	Record	Quality test
Eligible	Accounts and contacts that should receive the programme	Identity and eligibility verified
Reached	Delivery or in-product exposure	System evidence and timestamp
Responded	Reply, click, attendance, request, or other response	Do not treat an open as intent
Moved	The intended customer action or decision occurred	Observable evidence attached

Review This Section

Decision prompt: Which accounts were technically reached but still produced no useful evidence?

Record: _____

SECTION 3

Silence and Intervention

Silence becomes operational only when it has a trigger, an owner, and a bounded response.

Decision	Record	Owner
Silence condition	The missing response or movement that matters	Programme owner
Trigger	The event or elapsed time that changes the treatment	Data owner
Human response	The smallest useful intervention	Named role or person
Reset	What returns the account to a digital path	Review date

Review This Section

Decision prompt: When does silence stop being an automated journey and become a human decision?

Record: _____

SECTION 4

Learning Record

The programme should become more useful because the team can inspect what changed, not because more activity was sent.

Record	Complete this	Next decision
Observed pattern	What happened across the segment	Keep, change, or stop
Contrary evidence	What weakens the current programme theory	New test required
Customer input	What customers said or requested	Content or journey change
Next cycle	One controlled change	Owner and review date

Review This Section

Decision prompt: What did this cycle teach the team about the segment, message, trigger, or human response?

Record: _____

CHURN IS DEAD

Digital Programme Review Record

Record	Complete this
Programme and segment	_____
Intended customer movement	_____
Ledger state	Movement / Response / Silence / Unverified
Decision	Keep / Change / Narrow / Stop
Human intervention	_____
Owner and date	_____
Next review date	_____

Ledger state	Use when	Required record
Movement visible	The customer completed a meaningful next action	Evidence, source date, and next decision
Response without movement	The customer engaged but the intended outcome did not change	Blocker, owner, and next test
Unresolved silence	The programme reached the account but no useful response is visible	Trigger, human owner, and intervention date
Unverified reach	Delivery or identity evidence is incomplete	Data repair owner and due date

What to do next: Choose one digital segment and inspect the last complete customer cycle. Find one account where reach was recorded but response, movement, or ownership was not. Assign the next intervention and its review date.
